

## Ecommerce agenda, future of labor and the gender gap

By Sofia Scasserra\*

For many years now, the trade agreements have been trying to reshape the ways of production by approving a new e-commerce agenda that will determine the free flow of data. This agenda will affect development in the global south as well as the new ways of production. However, who will be the less fortunate in these changes? Probably the women and the racial minorities, for many reasons. These reasons are addressed in the given paper that we present.

The conclusions are given after years of research in the field, investigating trade agreements such as TISA or the ones that are pushed forward at the WTO.

This paper tries to explain how structural changes in data flow affect the future of labor, how these changes are already reshaping society and specially, how these effects are different in Latin America from other economies. The impact on labor rights is also different in Europe from the global south, which has been experiencing massive population inclusion periods with a huge gain on them. Technology set out a new opportunity to maintain those rights even with right-wing governments in power. In addition, the impacts on women and minorities is important, where they will be the most affected through the new algorithm-driven economy.
